The "vitoids." A theory of the fundamental substances of living matter. W. W. Lepeschkin. Biodynamica No. 19, 6 pp. (1931). Evidence is advanced in support of the hypothesis that living protoplasm consists of complex of proteins and lipoids, having the nature of large mol. compds., termed vitaproteids or vitoids.
W. Gordon Rose

LEPESHKIN, V.V.

✓ Temperature coefficients for the heat denaturation of serum proteins. W. W. Lepeschkin. *Kolloid-Z.* 140, 42-3 (1965); cf. *C.A.*, 17, 403, 1480, 2890.—L. suggests that heat denaturation, which commences with hydrolysis, destroys the —S—S— bonds, thereby facilitating further chem. changes. These bonds lie much deeper in the albumin mol. than in the globulin mol., so that water mols. must traverse a longer path to reach them. Temp. coeffs. for serum albumin (I) are larger than either pseudoglobulin (II) or euglobulin (III). α_1 for I between 50.1, 58.0 and 69.0°, 23 and 10×10^3 ; for II between 67.0, 69.0 and 71.8°, 74 and 84×10^3 , resp.; for III between 67.0, 69.8, 72.1 and 74.1°, 01, 18 and 34×10^3 , resp. At any one temp., I, which is most hydrophilic, has the fastest rate of denaturation. M. Fishman

Potassium deposits of the southern basin of the Permian Sea and the salt lakes of Western Kazakhstan
Kurnakov, I. N., Tepshikov, D. I., Radushkevich, N. I.
Bulyakov, Bull. Acad. of U.S.S.R., Geolog. Inst.,
Nat., No. 1, 1938, English 1938. K
Deposits were discovered in the Western Kazakhstan territory and the adjoining regions (Saratov, Aksayubinsk and Orenburg). The deposits should be referred to the Permian age. Besides chlorides, the sulfates in the form of kainite, polyhalite, etc., were also found. The salt lakes of the northeastern coast of the Caspian Sea are also of a great interest, since the presence of the sediments of sulfates as astral halite, epsomite, glauberite or mirabilite was observed. The complex of about 112 samples from various deposits and depths are tabulated. Thirty-three references.

PROCESSES AND PROPERTIES

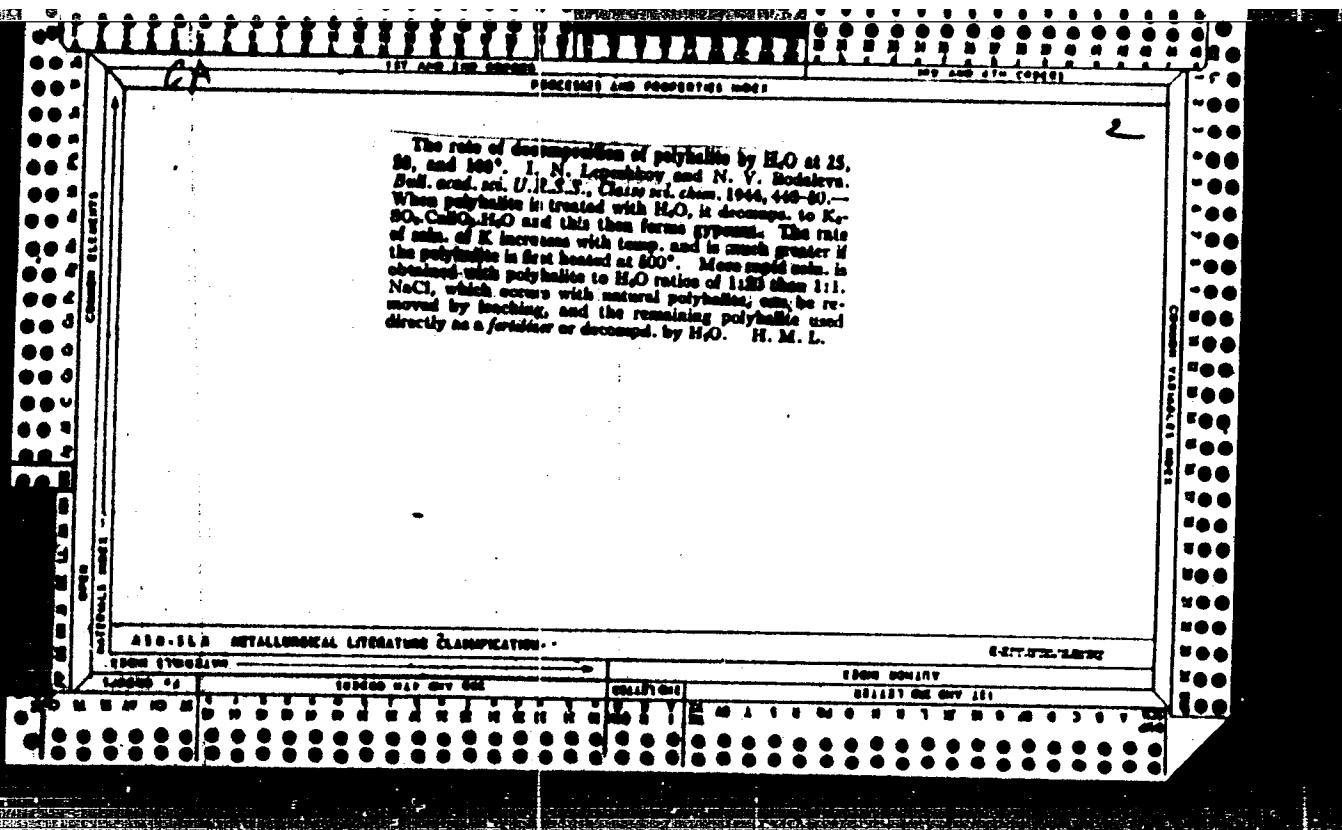

Potassium salts of the western regions of Ukraine. N. Lepeshkov. Bull. Acad. Sc. U.R.S.S., Classe de chim., 1960, 405, 19 (in English, 419). The salt deposits north of Carpathian Mountains and south of Podolia, a territory of about 300 sq. km., are described; the thickness of the deposits reaches 70-80 m.; they are found at a depth from 30 to 800 m. and are estd. to amount to 300 million tons. The salts of the Kaluza region are represented by sylvite and kainite; the deposits of Golynt mostly by sylvinites (18-21% K₂O); and the deposits of Stebnick by sylvinites, kainite, langbeinite and kieserite. Mean chemical and mineralogical compo. of the deposits are tabulated. J. G. Tolpin

TITLE:

On the Formation of Primary Polyhalite (K voprosu ob
obrazovanii pervichnogo polyhalita)

PERIODICAL:

Zhurnal Neorganicheskoy Khimii, 1958, Vol 3, Nr 5,
pp 1261-1264 (USSR)

ABSTRACT:

Experiments for the explanation of the process of formation of primary polyhalite were carried out at 55°C by the evaporation of synthetic solutions by adding aqueous calcium sulfate solutions. The chemical analysis of the obtained deposit showed that more than 95% of the deposit consists of purest polyhalite - $K_2SO_4 \cdot MgSO_4 \cdot 2 CaSO_4 \cdot 2 H_2O$ - .

The microscopical investigations confirm this result. It results from the thermographic curve that a complete dehydration of polyhalite occurs at 32°C and that melting begins at 88°C.

The formation of primary polyhalite was confirmed by the chemical crystallo-optical and thermographical analysis.

Physicochemical Investigation of the K_2SO_4 - $MgSO_4$ - $CaSO_4$ - H_2O System at 35° (Fiziko-khimicheskoye izuchenie sistemy K_2SO_4 - $MgSO_4$ - $CaSO_4$ - H_2O pri 35°)

PERIODICAL:

Zhurnal neorganicheskoy khimii, 1958, Vol 3, Nr 10,
pp 2395-2407 (USSR)

ABSTRACT:

An investigation was carried out at $35^\circ C$ of the solubility of the salts, the viscosity and specific weight of solutions of the system K_2SO_4 - $MgSO_4$ - $CaSO_4$ - H_2O , as well as of the ternary systems K_2SO_4 - $MgSO_4$ - H_2O , K_2SO_4 - $CaSO_4$ - H_2O and $CaSO_4$ - $MgSO_4$ - H_2O belonging to this system. In the investigation of the four-component system the following salts were ascertained: polygallite -($K_2SO_4 \cdot MgSO_4 \cdot 2CaSO_4 \cdot 2H_2O$)-, singenite -($K_2SO_4 \cdot CaSO_4 \cdot H_2O$)-, gypsum -($CaSO_4 \cdot 2H_2O$)-, $K_2SO_4 \cdot 5CaSO_4 \cdot H_2O$, schenite -($K_2SO_4 \cdot MgSO_4 \cdot 6H_2O$)-, epsomite - $MgSO_4 \cdot 7H_2O$)- and arcanite (K_2SO_4). Polygallite is formed

Card 1/3

Physicochemical Investigation of the K_2SO_4 - $MgSO_4$ -
 $CaSO_4$ - H_2O , System at $35^{\circ}C$

SOV/78-3-10-27/35

in the system analyzed at $35^{\circ}C$ only in the range of higher concentration of magnesium sulfate. The crystallization range of polygallite is extended considerably when temperature is increased. In the solid phase of the system temperature is at $35^{\circ}C$ in paragenesis with gypsum, singenite, polygallite and epsomite. In the potassium deposits of the Volga-Emb and the Carpathians, polygallite is in paragenesis with the following sulfates: anhydrite -($CaSO_4$)-, gypsum, kieserite-($MgSO_4 \cdot H_2O$)-, langbeinite -($K_2SO_4 \cdot 2MgSO_4$)- and glaserite -($3K_2SO_4 \cdot Na_2SO_4$). The results of the solubility of the ternary systems correspond to those obtained from the investigations of viscosity and specific weight of the systems. The results of the physicochemical analysis of the four-component system K_2SO_4 - $MgSO_4$ - $CaSO_4$ - H_2O are of importance for the explanation of the formation of natural polygallite. The formation of polygallite in nature, which is caused by evaporation of sea water, takes place probably at relatively low temperatures ($10-35^{\circ}C$).

The Isothermal Lines of the Solubility of the System
 $K_2SO_4-Na_2SO_4-MgSO_4-H_2O$ at 75°C (Izoterma rastvorimosti sistemy
 $K_2SO_4-Na_2SO_4-MgSO_4-H_2O$ pri 75°)

PERIODICAL:

Zhurnal neorganicheskoy khimii, 1958, Vol 3, Nr 9, pp 2156-2164
(USSR)

ABSTRACT:

The solubility of the quaternary system $K_2SO_4-Na_2SO_4-MgSO_4-H_2O$ and of the ternary system $K_2SO_4-Na_2SO_4-H_2O$ was investigated at 75°C. In the investigations of the ternary system K_2SO_4- $Na_2SO_4-H_2O$ a solid phase of varying composition of the glaserite type was found which is to a great extent enriched with potassium sulfate. The maximum ratio of $K_2SO_4 : Na_2SO_4$ is in this compound 3,75 : 1. The solubility diagram of the aqueous quaternary system of potassium sulfate - sodium sulfate - magnesium sulfate is characterized by the occurrence of 3 crystallization ranges of the following salts:
